

Q) Create a REST API for an employee schema. The employee schema should have the following structure:

```
{
  emp_name: String,
  job_name: String,
  hire_date: Date,
  salary: Number
}
```

After creating the REST API, protect all the routes by JWT authentication system.

**Note:**

- Try to avoid putting the JWT token in the URL. Instead try to use HTTP request headers or cookies to send the token. [Reference](#)
- You can also use a Dummy in memory Employee array to temporarily store the employee's data. (Using MongoDB is optional)

**Marking Scheme**

[Correct Code Execution: 10, Correct Approach: 3, Code Readability: 2]
